TITLE OF INVENTION

THREAD-SUPPLYING DEVICE FOR TEXTILE MACHINES

APPLICANT(S) FOR DO/EO/US

Herman Schmodde, Richard Kaufmann and Gunter Leopold

Applicant herewith submits to the United States Designated/Elected Office (DO/EO/US) the following items and other information:

1. ☒ This is a **FIRST** submission of items concerning a filing under 35 USC 371 and 37 CFR 1.491.
2. ☐ This is a **SECOND** or **SUBSEQUENT** submission of items concerning a filing under 35 USC 371 and 37 CFR 1.491.
3. ☒ This is an express request to begin national examination procedures (35 USC 371(f)).
4. ☒ The US has been elected by the expiration of 19 months from the priority date (PCT Article 31).
5. ☒ A copy of the International Application as filed (35 USC 371(c)(2))
 - a. ☐ is attached hereto (required only if not communicated by the International Bureau).
 - b. ☒ has been communicated by the International Bureau.
 - c. ☐ is not required, as the application was filed in the United States Receiving Office (RO/US).
- ☒ An English language translation of the International Application as filed (35 USC 371(c)(2)).
- ☒ Amendments to the claims of the International Application under PCT Article 19 (35 USC 371(c)(3))
 - a. ☐ are attached hereto (required only if not communicated by the International Bureau).
 - b. ☒ have been communicated by the International Bureau.
 - c. ☐ have not been made; however, the time limit for making such amendments has NOT expired.
 - d. ☒ have not been made and will not be made.
8. ☐ An English language translation of the amendments to the claims under PCT Article 19 (35 USC 371(c)(3)).
- ☒ An unexecuted oath or declaration of the inventor(s) (35 USC 371(c)(4)).
10. ☐ An English language translation of the annexes to the International Preliminary Examination Report under PCT Article 36 (35 USC 371(c)(5)).
11. Nucleotide and/or Amino Acid Sequence Submission
 - a. ☐ Computer Readable Form (CRF)
 - b. Specification Sequence Listing on:
 - i. ☐ CD-ROM or CD-R (2 copies); or
 - ii. ☐ Paper Copy
 - c. ☐ Statement verifying identity of above copies

Items 12 to 19 below concern other document(s) or information included:

12. ☐ An Information Disclosure Statement under 37 CFR 1.97 and 1.98.
 - ☐ Form PTO-1449
 - ☐ Copies of Listed Documents
13. ☐ An assignment for recording. A separate cover sheet in compliance with 37 CFR 3.28 and 3.31 is included.
14. ☒ A FIRST preliminary amendment.
☐ A SECOND or SUBSEQUENT preliminary amendment.
15. ☐ A substitute specification.
16. ☐ A change of power of attorney and/or address letter.
17. ☒ Application Data Sheet Under 37 CFR 1.76
18. ☒ Return Receipt Postcard
19. ☐ Other items or information:

PRELIMINARY AMENDMENT

Commissioner for Patents
Washington, D.C. 20231

Dear Sir:

Prior to the examination of the above-identified patent application, please enter the following amendments and consider the following remarks.

AMENDMENTS

IN THE TITLE:*Replace the title with:*THREAD-SUPPLYING DEVICE FOR TEXTILE MACHINES**IN THE SPECIFICATION:**

At page 1, after the title, insert the following heading:

FIELD OF THE INVENTION

Replace the paragraph beginning at page 1, line 3 as follows:

The invention relates to a yarn feeder.

*At page 1, after line 4, insert the following heading:*BACKGROUND OF THE INVENTION*Replace the paragraphs beginning at page 1, line 5 as follows:*

Yarn feeders commonly are vendor supplied parts or accessories for textile machines and particularly in loop-forming textile machines are often found in great numbers thereon. The yarn feeders each feed one yarn to a yarn-using station, such as a knitting station. The quality of the knitted goods produced depends decisively on the precision and reliability of the yarn feeders. On the one hand, this demands precision manufactured - yet on the other hand, the yarn feeders should be as simply embodied, economical, and simple to make and maintain as possible. Furthermore, they must perform reliably even if operated for relatively long periods without special maintenance and in particular without cleaning. Deposits of dust or fluff must not impair operation.

The goal also is to design a yarn feeder such that it can be adapted in a simple way to different kinds of use.

Page 2, after line 9, insert the following heading and paragraphs:

OBJECTS AND SUMMARY OF THE INVENTION

It is an object of the invention to provide a reliably operable yarn feeder that can be more simply and economically produced.

The invention is carried out by a yarn feeder which has a plastic housing with a fastening clamp specially designed to withstand clamping forces.

Replace the paragraphs beginning at page 2, line 14, to page 4, line 7 as follows:

The special design of the fastening clamp permits the clamp to have a narrow profile with the required stiffness and strength that retaining devices can be mounted on a retaining ring of a textile machine without the fastening clamps being a hindrance to each other. To that end, the invention provides on the one hand the possibility of embodying a jaw-like clamp on or in a box-like housing portion. Alternatively, the jaw-like clamp can be provided with reinforcement ribs on its side pointing away from the jaw, which also furnish the desired strength if they extend upwardly sufficiently, or in other words away from the retaining ring of the textile machine. On the textile machines, the spacing between the retaining ring and a drive belt for driving the yarn feeders is usually structurally specified by the construction. It has been found that the reinforcing ribs are

adequately large if, viewed from the retaining ring, they protrude past the plane defined by the lower edge of the belt. In this way, it becomes possible for yarn feeders with the yarn guide drum, which are used to feed the yarns, for instance to knitting stations of a circular knitting machine and which must be relatively narrow in structure, to be formed of plastic with the housing of the fastening clamp. The significant forces that can be incurred by yarn feeders by the revolving drive belt are thus reliably absorbed and dissipated.

The yarn feeder, more particularly, may have a housing with at least 2 housing parts, each of which has a respective bearing means for the continuous shaft. Thus both housing parts, embodied in clamshell fashion, jointly conduct the incident support forces of the bearing means to the fastening device and thus to the textile machine, which acts as a stationary bearing for the yarn feeder. This in turn makes it possible to divide the housing over a large area so that in the dismantled state, unhindered access to the housing interior is possible. Once the two housing parts are put together, they are joined correctly by a connecting means, and as a result the housing is closed. Assembly is relatively quite uncomplicated. The dividing seam between the housing parts is preferably disposed substantially horizontally or slightly inclined, so that at least outside the fastening device, it extends along the side faces of the housing. This makes the interior of the housing parts easily accessible. During assembly, parts to be disposed in the interior can simply be introduced into it. This further simplifies assembly.

As bearing means, ball bearings are preferably provided, which are received in appropriate bearing seats of the housing parts. For bearing seats, tubular extensions can for instance be provided, which are formed on the housing parts and extend outward away from them. The ball bearings are preferably introduced from outside into the bearing seats. In a preferred embodiment, the lower bearing seat, toward the yarn guide drum, extends into the yarn guide drum. This enhances the spacing between the two ball bearings, resulting in good support of the shaft with little play. To drive the shaft and the yarn guide drum, a plurality of toothed-belt pulleys or other kinds of pulleys can be disposed on the other end of the shaft as needed, with a belt traveling along the pulleys. The resultant support forces on the ball bearing are readily absorbed by wide support spacing. Also by means of the bearing seat extending into the yarn guide drum, [it is

attained that] in the event of an error a yarn will not be wound onto the shaft, and this increases the operational safety.

Replace the beginning at page 4, line 26 with the following:

The fastening device on the machine is formed for instance by a jaw-like clamp, which is embodied on at least one of the housing parts. The housing parts preferably, however, fit over one another in the region of the fastening device, so that each housing part and thus each bearing seat is joined to the fastening device in a way that directly transmits force. This makes possible good absorption of the retaining forces by the housing and good transmission of the support forces to the fastening device and the retaining device. To reinforce this, the housing parts in one embodiment are joined together in the region of the fastening device by at least one support means. The jaw of the fastening device can then be embodied such that on one side, one housing part has a bearing and clamping face, while on the opposite flank or side the other housing part defines the bearing and clamping face. As a result, when the fastening device is clamped firmly by means of a clamping screw that is braced on one leg and disoriented perpendicular to the clamping face, both housing parts are braced against one another.

At page 5, after line 36 insert the following paragraph and heading:

Other objects and advantages of the invention will become apparent upon reading the following detailed description and upon reference to the drawings, in which:

BRIEF DESCRIPTION OF THE DRAWINGS

Delete the paragraphs beginning at page 5, line 37 to page 8, line 40 and insert the following:

FIGURE 1 is a side elevational view of an illustrative yarn feeder embodying the present invention;

FIG. 2 is an enlarged perspective of the yarn feeder shown in FIG. 1;

FIG. 3 is a diagrammatic depiction of a plurality of yarn feeders, such as shown in FIGS. 1 and 2, disposed on a retaining ring of a textile machine;

FIG. 4 is a side elevational view of an alternative embodiment of yarn feeder embodying the present invention;

FIG. 5 is an enlarged vertical section of the yarn feeder shown in FIG. 4;

FIG. 6 is a perspective of a first or lower housing part of a yarn feeder such as shown in FIGS. 1 or 3;

FIG. 7 is a side view of the housing part shown in FIG. 6;

FIG. 8 is a perspective of a second or upper housing part of the yarn feeder such as shown in FIGS. 1 and 3;

FIG. 9 is an end view of the yarn feeder housing, with the fastening clamp region in section;

FIG. 10 is a side elevational view of the housing of the yarn feeder, shown in partial section in the region of the fastening clamp thereof;

FIG. 11 is a perspective of a yarn brake adapted for mounting on the housing of the illustrated yarn feeder;

FIG. 12 is a perspective of a coupling clamping device for fastening fixtures to the yarn feeder;

FIG. 13 is a perspective of a cover cap for the coupling device shown in FIG. 12; and

FIG. 14 is a perspective of an alternative embodiment of fastening device for the yarn feeder.

While the invention is susceptible of various modifications and alternative constructions, certain illustrated embodiments thereof have been shown in the drawings and will be described below in detail. It should be understood, however, that there is no intention to limit the invention to the specific forms disclosed, but on the contrary, the intention is to cover all modifications, alternative constructions and equivalents falling within the spirit and scope of the invention.

At page 6, after line 29, insert the following heading:

DETAILED DESCRIPTION OF PREFERRED EMBODIMENTS

Replace the paragraphs beginning at page 6, line 30 to page 8, line 39 with the following:

Referring now more particularly to FIGS. 1 and 2 of the drawings, there is shown an illustrative yarn feeder 1 embodying the present invention adapted for feeding a yarn 2 to a textile-processing machine, such as a knitting machine. The yarn feeder 1 has a housing 3, which serves as a basic carrier for all the elements of the yarn feeder 1. On one end, the housing 3 is provided with a fastening device 4, which is arranged to support and secure the yarn feeder 1 on a suitable retainer 5, such as a rail or a ring of the textile machine, as depicted the ring may have a rectangular cross section and an electric connection cable laid along its outside. A belt 5a serves to drive all the yarn feeders 1.

As shown in Fig. 5 (in conjunction with a slightly modified embodiment), a vertically disposed shaft 6 is rotatably supported in the housing 3. For bearing purposes, two ball bearings 7, 8 are used, which are held in respective bearing seats 9, 10 of the housing 3.

The shaft 6 on its lower end has a yarn guide drum 12, around which the yarn 2 is wrapped once or multiple times. The yarn guide drum 12 is carried and driven by the shaft 6. To that end, the shaft 6 on its upper end has one or more toothed-belt pulleys 14, 15, which in this case are rotatably supported on the shaft 6 by ball bearings 16, 17.

The toothed-belt pulley 14 meshes with the belt 5a, whose lower edge is depicted in Fig. 5 by a dot-dashed line. Between the toothed-belt pulleys 14, 15, a displaceable coupling disk 18 is disposed. On both of its flat sides, the disk has toothed coupling rings 21, 22, with which the toothed-belt pulleys 14, 15 can be coupled alternatively with the shaft 6 and thus serve as a drive device for the shaft. The coupling disk 18 is provided with coupling prongs for this purpose.

The housing 3 is preferably constructed in multiple parts. In that case it first has a lower housing part 25, which is shown separately in Figs. 6 and 7. The housing part 55 is a substantially clamshell-like injection molded part. For forming the fastening device 4, the housing part 25 has a portion 26 in the form of a U in side view, whose jaw opens downward and whose inner contour is adapted for receiving a fastening rail (retaining device) on the machine. On the legs 26a that define the jaw, lateral protrusions 27 are provided for transmitting an outward-oriented force, which spreads the jaw wider, to the

other mating housing cart 33. Thus the leg 26a is the leg that is primarily supported on the retaining device and in turn on a corresponding leg of the housing part 33 (Fig. 9). On the opposite side of the jaw, the conditions are reversed. The leg 26b on that side is supported secondarily, or in other words indirectly on the retaining device. Support cleats 28 act as abutments for corresponding parts (82, Fig. 9) of the corresponding leg of the housing part 33, which comes directly (primarily) into contact with the retaining device.

The fastening device 4 is formed on the housing 3 as a fastening clamp by the housing 3; for that purpose, no force-carrying elements, reinforcing elements or the like of any kind made of material extraneous to the housing are provided. The cross section of the housing 3 in the region of the fastening device 4 can be seen in Fig. 10. The upper housing part 33 and the lower housing part 25 together define a hollow profile, approximating a box profile. The housing 3 can be put together in such a way that the housing part 25, which in the section shown in Fig. 10 is approximately flat, has the upper housing part 33, which here is U-shaped fitting over it. In the interior enclosed by them, reinforcement ribs 33a, 33b, 33c can be provided. As needed, these ribs can also fill the interior almost entirely or entirely. However, relatively narrow ribs, of the kind also seen in Fig. 8, are preferred. The somewhat wider middle rib 33b can, as seen in Fig. 8, in turn be divided into ribs, so that an overly large plastic volume does not occur at any point of the housing part 33 excessively great material thickness can thus be avoided.

The hollow profile-like embodiment of the clamp, formed by the two housing parts 25, 33, and the optionally provided inner ribs 33a, 33b, 33c assure adequate rigidity of the fastening device 4 with respect to forces which have a tendency to spread the jaw wider. The fastening device 4 can thus be made so narrow that it does not protrude laterally past the yarn feeder, or does so at most only slightly, so that as shown in Fig. 3 the yarn feeders 1 have space side by side on the retaining ring 5.

Replace the paragraphs beginning at page 9, line 12 to page 10, line 23 as follows:

As seen from Fig. 6, at least two metal strips 33, 39, are placed in suitable receptacles in the housing part 25 and are retained in corresponding slits. The metal strip 38, which is in the form of a U-shaped hoop, is for instance connected to ground potential and has notches 41, 42, 43, 44 for the pivotable bearing of an inlet-side yarn feeler 45 and

an outlet-side yarn feeler 46 and also has an eyelet 47, in order to make a ground connection with external fixtures. This connection is made particularly with fixtures that come into contact with the yarn 2. Other stationary or moving yarn guide elements may, but need not, be grounded.

The metal strip 39 may lead to switches 48, 49, actuated by the yarn feelers 45, 46, of two separate shutoff current circuits. On its end remote from the switches 48, 49, the strip may define a clamp contact for an electronic component 51. This component may in turn be connected by its other end to a clamp contact of a further conductor 52. For contacting a line provided on the retainer on the machine, windows 53, 54 extending in the region of the fastening device 4 into the housing interior are provided, through which connection elements can reach. In the vicinity of the fastening device, a single indicator light 50 for both shutoff current circuits is disposed, which lights up as soon as one of the switches 48, 49 is actuated, or in other words as soon as one of the yarn sensors has been pivoted downward. The indicator light is inserted into a stamped conductor track.

The upper housing part 33 is depicted in Figs. 8 and 9 has clamshell shape and in its interior, it has hollow pegs 61, 62 for receiving the pegs 34, 35 of the lower housing part 25. A recess 63 of circular cross section is provided for receiving the hollow peg 36, and a threaded bore for a fastening screw 64 (see Fig. 5) is provided on its bottom. The bottom is formed, as will be explained hereinafter, by a part of a coupling device. For adjusting the housing parts 33, 25, and particularly to attain adequate alignment of the ball bearings 7, 8 with one another, a suitable seat is embodied in the housing part 33 in order to receive the tubular extension 32. This seat is formed substantially by a stepped bore which is capable of receiving the upper end, formed somewhat conically if needed, to the tubular extension 32. For low-play or play-free centering of the free end of the extension 32, axially oriented ribs 66 may be disposed on the circumference of the approximately cylindrical outer surface of the seat 65. On the outside of the housing part 33, the bearing seat 9 is embodied, coaxially to the seat 65 on the inside.

Replace the paragraphs beginning at page 10, line 35 to page 12, line 18 as follows:

In the housing 3, and in the present exemplary embodiment in the housing part

33, a feeler barrier 71 is supported longitudinally displaceably as can be seen from Figs. 1, 8 and 9. It is formed by a sheet-metal strip whose free end, embodied as a handle 72, protrudes out of the housing part 33. To that end, a depression 73 visible in Fig. 1 is formed on the housing part 33, and an angled end of the feeler barrier 71 is disposed in the depression. The feeler barrier 71 is displaceably supported and is profiled in such a way that it pivots first one feeler lever (45) and then the other feeler lever (46) from a freely downward-hanging position into an upper position upon actuation.

As seen particularly from Fig. 12, a jaw-like portion 80 of the fastening device housing part 33 and can fit over the portion 26 of the lower housing part 25. It has a rear bearing depression 81, into which the protrusions 27 (Fig. 7) off the lower housing part 25 can move. On the opposite side, conversely, a bearing region 82 is formed, which is braced on the support cleats 28 of the lower housing part 25, when it is urged in the region that stretches the jaw open.

Between the housing parts 25, 33, an approximately horizontal dividing seam 83 is formed. The housing parts 25, 33 fit in one another here. Approximately in a rectilinear extension of the dividing seam 83, in the region of the fastening device 4, a coupling clamping device 84 is formed, which is shown separately in Fig. 12 as a component of the upper housing part 33. It is termed by a flat guide plate 86, connected to the housing part via ribs 85, and its free end has a female-threaded hollow peg 87, which forms the bottom of the recess 63. The hollow peg 87 is carried by the guide plate 36 and protrudes freely into the recess 63. The fastening screw 64 is seated in the hollow peg 37 and holds the two housing parts 25, 33 together, and once it is tightened it deforms the guide plate 85 somewhat. A foot 187, slipped onto the guide plate and having a shape complimentary to the guide plate is firmly clamped thereby. The foot 187 has two cleats 188, 139, which fit with little play into the interstice between the guide plate and the adjacent housing face period. When the guide plate 86 is deformed, the foot 187 clamps. In Fig. 4 and Fig. 9, a cover cap 89 is thereby retained; this cap being shown separately in Fig. 13. As needed, however, this cap can be removed and replaced with a retaining hoop 90, as shown in Fig. 1 or Fig. 2. By way of example, the retaining hoop can carry yarn guide means, such as a tubule 91. The retainer hoop 90 can fit over the toothed-belt pulleys 14, 15 with its clamping retainer being disposed in the immediate vicinity of the fastening 4.

For secure fastening of the ball bearings 7, 8 and the bearing seats 9, 10, elastomer elements are disposed between the respective ball bearings 7, 8 and the bearing seat 9, 10. The bearing seats 9, 10 preferably are provided on the inside with longitudinal ribs or regions protruding in other ways, so that the elastomer elements, in the region off the longitudinal ribs, are compressed somewhat between the outer bearing ring and the rib. The elastomer elements have a compensatory effect for temperature changes, shrinking from aging, and production variations.

Replace the paragraphs beginning at page 12, line 31 to page 13, line 20 with the following:

While the yarn guide element 96 is embodied as a hook and is retained non-displaceably, the yarn guide eyelet 97 may be adjustable, as an antifilamentation device. For instance, the yarn guide eyelet 97 may be embodied as a wire hoop, whose two ends have a foot that is displaceably supported on the housing 3. To that end, the lower housing part has one pocket 98, visible in Fig. 8, on both sides, the pocket having vertical end faces. The upper housing part 33 (Fig. 8) has cheeks 101, 102, which are associated with the pockets 98 and are profiled on their inside in such a way that on both sides of the pockets 98 they have guide grooves 103, 104, into which the wire hoop can snap. For adjustment purposes, the hoop can thus be compressed and transferred out of the guide groove 103 into the guide groove 104, and vice versa. The lower free end of the hoop, forming an eyelet, can thus be transferred from a first position, in which it is located virtually at the same level as the lower rim or the yarn guide drum but spaced apart from this drum, to a second position in which it is located relatively far below the lower rim but horizontally closer to it.

Optionally, a yarn brake 105, which may be driven, is provided on the yarn feeder 1. As needed, a non-driven yarn brake can also be provided. The yarn brake 105 has two rings 106, 107, visible particularly from Fig. 11, which each have one inner and one outer rim; the rims of the two rings 106, 107 are curved away from one another. Permanent magnets 108 urge the rings 106, 107 elastically against one another.

Replace the paragraph at page 13, line 27 with the following:

The wire hoop 112 has two hoops 116, 117, which carry the guide element 111 and the rings 106, 107. The legs are supported longitudinally displaceably in a guide part 118. The leg 117 has an end bent inward, that is, toward the rings 106, 107, on which end an intermediate element 120 is held, being braced on the guide element 118 via a helical spring 119 or other kind of spring. The other leg 116 is approximately aligned with the free end of the leg 117 but is bent away from it. The end has a tappet 121, which also may be formed by a cap-shaped plastic part.

Replace the paragraphs beginning at page 16, line 20 to page 17, line 7 with the following:

A modified embodiment of the yarn feeder 1 is shown in Fig. 4. It differs from the above-described yarn feeder 1 in terms of the embodiment of the fastening device 4. The fastening device is provided, on the side remote from the jaw, with reinforcing ribs 33a', 33b', 33c', which belong to the housing part 33 and whose special feature is that they protrude front the level that is defined by the lower edge of the drive belt as indicated in the dot-dashed lines Fig. 14. The wall thickness of the ribs 33a', 33b', 33c' is overly great and is substantially less than their respective height. This makes the fastening device 4 so resistant to widening forces that it is possible to dispense with introduction elements, metal inlays or other stiffening additional elements in the clams. Only the nut 140 visible in Fig. 5 is needed. Other metal elements can be omitted.

From the foregoing, it can be seen that the yarn feeder 1 of the invention has a plastic housing 3, preferably made of two clamshells. For connection to a retainer on the machine, a fastening device 4 is provided that also is made of plastic. The fastening device 4 is made rigid by suitable shaping which may eliminate the necessity for metal inlays. The two halves of the housing each have one bearing for a continuous shaft, which on one end carries a yarn guide drum and on its other end carries pulleys 14, 15, for instance, as a drive device. Fastening means serve to hold the two housing parts together in the correct position. The housing 3 is easy to open for maintenance purposes.

IN THE CLAIMS:

Cancel claims 1-15 and substitute therefore the following new claims 16-40:

16. (New) A yarn feeder (1) particularly adapted for use in textile machines comprising:
- a housing (3) having a fastening clamp (4) for securing the yarn feeder to a retaining device of a textile machine;
 - said housing (3) being made of plastic;
 - said fastening clamp (4) having a box-like cross-sectional profile with portions that incur clamping forces when said fastening clamp is fastened to a retaining device; and
 - said fastening clamp portions being formed entirely of the plastic material of said housing.
17. (New) The yarn feeder of claim 16 in which said fastening clamp (4) has a jaw for receiving the retaining device on the textile machine.
18. (New) The yarn feeder of claim 17 in which said housing has two parts (25, 33), and said jaw is formed on one of the housing parts (25, 33).
19. (New) The yarn feeder of claim 17 in which the housing pads (25, 33) fit over one another in the region of the fastening device (4), and said housing parts (25, 33) are joined together by at least one support (27, 28) in the region of the fastening device (4).
20. (New) The yarn feeder of claim 16 including a coupling device (86) for connecting at least one further housing component (89, 90) as required on the housing (3).
21. (New) The yarn feeder of claim 20 in which said coupling device (86) is disposed above the fastening clamp (4).
22. (New) The yarn feeder of claim 16 in which the housing (3) has receptacles into which metal elements (38, 39) are disposed and which serve as conductor tracks for electrical components associated with the yarn feeder.
23. (New) The yarn feeder of claim 16 in which an electrically grounded

conductor is disposed within the housing and is connected to at least one metal element (95) that is in contact with yarn being fed by the yarn feeder.

24. (New) The yarn feeder of claim 23 including movable yarn sensor elements (45) supported on the metal elements.

25. (New) The yarn feeder of claim 16 in which the box-like cross-sectional profile of the fastening device (4) has an interior that includes ribs (33a', 33b', 33c') disposed in parallel relation to each other.

26. (New) A yarn feeder (1) particularly adapted for use in textile machines comprising:

- a housing (3) having a plastic fastening clamp (4) for fastening to a retaining device of a textile machine;

- a shaft (6) extending through said housing (3);

- a yarn guide drum (12) mounted adjacent an end of said shaft;

- a drive for rotating said shaft and yarn guide drum; said drive including at least one pulley (14) carried on said shaft and a drive belt for driving said pulley, said at least one pulley and drive belt being in spaced relation to one side of said yarn guide drum; and

- said fastening clamp (4) having portions (33a' 33b', 33c') extending beyond a plane defined by an edge of the drive belt on a yarn guide drum side of the belt.

27. (New) The yarn feeder of claim 26 in which said fastening clamp (4) has a jaw for receiving the retaining device on the textile machine.

28. (New) The yarn feeder of claim 27 in which said housing is in two parts, and said jaw is formed on one of the housing parts (25, 33).

29. (New) The yarn feeder of claim 26 in which the housing parts (25, 33) fit over one another in the region of the fastening clamp (4), and said housing parts (25, 33) are joined together by at least one support (27, 28) in the region of the fastening device (4).

30. (New) The yarn feeder of claim 26 including a coupling device (86) disposed above the fastening clamp (4) for connecting a further component (89, 90) onto the housing.

31. (New) The yarn feeder of claim 26 in which the housing (3) has receptacles into which metal elements (38, 39) are disposed and which serve as conductor tracks for electrical components associated with the yarn feeder.

32. (New) A yarn feeder(1) particularly adapted for use in textile machines comprising:

a housing (3) having a fastening clamp (4) for fastening to a retaining device of a textile machine;

a shaft (6) extending through said housing (3), a yarn guide drum (4) mounted adjacent an end of said shaft, a drive device(14) connected to another end of said shaft; yarn guides (95a, 97) for defining a yarn travel path toward and away from the yarn guide drum (12); at least two bearings (7, 8) for rotatably supporting said shaft (6);

said housing (3) having at least one first housing part (25) oriented toward said yarn guide drum (12) and having a bearing seat (10) for one of said bearings (8);

said housing (3) having at least one second housing part (33) oriented toward the drive device (14) and having a seat for the other bearing (7); and

at least one connector (64) for connecting the housing parts (25, 33) together in properly positioned relation.

33. (New) The yarn feeder of claim 32 in which said housing (3) has a substantially horizontal dividing seam (83) between said housing parts (25, 33), and said housing parts (25, 33) have alignment members (32, 34, 35) which locate the housing parts (25, 33) in proper positionable relation to each other.

34. (New) The yarn feeder of claim 32 in which said bearings (7, 8) are ball bearings, and said bearing seats (9, 10) are tubular members pointing away from each other integrally formed in the housing parts (25, 33).

35. (New) The yarn feeder of claim 34 in which one of said tubular portions is

oriented toward the yarn guide drum (12) and extends into an interior defined by the yarn guide drum (12).

36. (New) The yarn feeder of claim 33 including elastomer bearing receiving elements disposed between the bearing seats (9, 10) and the bearings (7, 8), and said bearing seats (9, 10) have interrupted bearing faces protruding radially inward in the direction toward the bearings (7, 8).

37. (New) The yarn feeder of claim 32 in which said fastening clamp (4) has a jaw for receiving the retaining device on the textile machine.

38. (New) The yarn feeder of claim 32 in which said housing is made of plastic.

39. (New) The yarn feeder of claim 38 in which an electrically grounded conductor is disposed within the housing and is connected to at least one metal element (95) that is in contact with yarn being fed by the yarn feeder.

40. (New) The yarn feeder of claim 39 including movable sensor elements (45) are supported on the metal elements.

IN THE ABSTRACT:

Replace the heading and Abstract with the following:

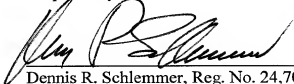

ABSTRACT OF THE DISCLOSURE

The yarn feeder having a plastic housing, preferably made of two clamshells, with a plastic fastening device for connecting the yarn feeder to a retaining device of a textile machine. The fastening device is made rigid by suitable shaping and without the necessity for metal inlays. The two clamshell halves of the housing each have a bearing for a continuous shaft, which on one end carries a yarn guide drum and on its other end carries pulleys for a drive device. Fasteners serve to hold the two housing parts together in the correct position for enabling easy opening of the housing for maintenance.

REMARKS

By the foregoing Preliminary Amendment, the specification and claims have been amended to improve their form and clarity for U.S. examination. For convenient reference, a clean copy of the specification is enclosed, together with a complete copy of the specification showing the added and deleted language.

Respectfully submitted,

Dennis R. Schlemmer, Reg. No. 24,703

AMENDMENTS TO SPECIFICATION, CLAIMS, AND ABSTRACT
MADE VIA PRELIMINARY AMENDMENT

IN THE TITLE:

Replace the title with the following:

THREAD-SUPPLYING DEVICE FOR TEXTILE MACHINES

IN THE SPECIFICATION:

At page 1, after the title, insert the following heading:

FIELD OF THE INVENTION

Amendments to the paragraph beginning at page 1, line 3:

The invention relates to a yarn feeder [having the characteristics of the preamble to claim 1, 2 or 3].

At page 1, after line 4, insert the following heading:

BACKGROUND OF THE INVENTION

Amendments to the paragraphs beginning at page 1, line 5 as follows:

Yarn feeders commonly are vendor supplied parts or accessories for textile machines and particularly in loop-forming textile machines are often found in great numbers thereon. The yarn feeders each feed one yarn to a yarn-using station, such as a

knitting station. The quality of the knitted goods produced depends decisively on the precision and reliability of the yarn feeders. On the one hand, this [makes] demands [in terms of] precision manufacture - yet on the other hand, the yarn feeders should be as simply embodied, economical, and simple to make and maintain as possible. Furthermore, they must [reliably] perform reliably [their function] even if [they are] operated for relatively long periods without special maintenance and in particular without cleaning. Deposits of dust or fluff must not impair operation.

The goal [is] also is to design a yarn feeder such that it can be adapted in a simple way to different kinds of use.

Amendments to the paragraphs beginning on page 1, line 34:

A yarn brake and a plurality of yarn guide elements are disposed upstream of the yarn guide drum. Further yarn guide elements are disposed downstream of the yarn guide drum. In addition, a shutoff lever and a yarn feeler lever are pivotably supported on the housing and actuate switches disposed in the interior of the housing in order to indicate a yarn break and to shut off the textile machine if necessary. For contacting a suitable electric line, connection means are provided on the fastening device, from which means electric lines lead to the appropriate switches in the interior of the housing. A signal light [is] also is disposed on the yarn feeder and signals an error state accordingly.

[These] Such yarn feeders have proven themselves in practice. However, they [require a certain expense for production] can be expensive to manufacture.

Page 2, after line 9, insert the following:

OBJECTS AND SUMMARY OF THE INVENTION

It is an object of the invention to provide a reliably operable yarn feeder that can be more simply and economically produced.

The invention is carried out by a yarn feeder which has a plastic housing with a fastening clamp specially designed to withstand clamping forces.

Amendments to the paragraphs beginning at page 2, line 10, to page 4, line 7:

[It is the object of the invention to reduce this expense.

This object is attained by a yarn feeder that has the characteristics of claim 1, 2 or 3.

In its embodiment according to claims 1 and 2, the yarn feeder has a plastic housing. The fastening clamp is also embodied of plastic.] The special design of the fastening clamp [according to claim 1 or 2 allows such a narrow design of this clamp,] permits the clamp to have a narrow profile with the required stiffness and strength[,] that [the] retaining devices can be mounted on [the] a retaining ring of a textile machine without the fastening clamps being a hindrance to each other. To that end, the invention provides on the one hand the possibility of embodying [the] a jaw-like clamp on or in a box [profile]-like housing portion. Alternatively, the jaw- like clamp can be provided with reinforcement ribs[,] on its side pointing away from the jaw, which also furnish the desired strength if they extend [relatively far upward] upwardly sufficiently, or in other words away from the retaining ring of the textile machine. On the textile machines, the spacing between the retaining ring and a drive belt for driving the yarn feeders is usually structurally specified by the construction [and defined uniformly]. It has been found that the reinforcing ribs are adequately large if, viewed from the retaining ring, they protrude past the plane defined by the lower edge of the belt. In this way, it becomes possible for [the] yarn feeders with the yarn guide drum, which are used to feed the yarns, for instance to knitting stations of a circular knitting machine and which must be relatively narrow in structure, to be [embodied] formed of plastic with [regard to] the housing of the fastening clamp. The [not inconsiderable] significant forces that [in particular] can be incurred by [engage the] yarn feeders [and are caused] by the revolving drive belt are thus reliably absorbed and dissipated.

The yarn feeder, [according to claim 3, has] more particularly, may have a housing with at least 2 housing parts, each of which has [one] a respective bearing means for the continuous shaft. Thus both housing parts, embodied in clamshell fashion, jointly conduct the incident support forces of the bearing means to the fastening device and thus to the textile machine, which acts as a stationary bearing for the yarn feeder. This in turn makes it possible to divide the housing over a large area[,] so that in the dismantled state, unhindered access to the housing interior is possible. Once the two housing parts are put together, they are joined [together positionally] correctly by a connecting means, and as a

result the housing is closed. Assembly is relatively quite uncomplicated. The dividing seam between the housing parts [is] preferably is disposed substantially horizontally or slightly inclined, so that at least outside the fastening device, it extends along the side faces of the housing. This makes the interior of the housing parts easily accessible. [In] During assembly, parts to be disposed in the interior can simply be introduced into it. This further simplifies assembly.

As [the] bearing means, ball bearings are preferably provided, which are received in appropriate bearing seats of the housing parts. [As the] For bearing seats, tubular extensions can for instance be provided, which are [embodied] formed on the housing parts and extend outward away from them. The ball bearings are preferably introduced from outside into the bearing seats. In a preferred embodiment, the lower bearing seat, toward the yarn guide drum, extends into the yarn guide drum. This [maximized] enhances the spacing between the two ball bearings, resulting in good support of the shaft with little play. To drive the shaft and the yarn guide drum, a plurality of toothed-belt pulleys or other kinds of pulleys can be disposed on the other end of the shaft as needed, with a belt traveling along the pulleys. The resultant support forces on the ball bearing are readily absorbed by [the] a wide support spacing. Also by means of the bearing seat extending into the yarn guide drum, [it is attained that] in the event of an error a yarn will not be wound onto the shaft, and this increases the operational safety.

At page 5, after line 36 insert the following:

Other objects and advantages of the invention will become apparent upon reading the following detailed description and upon reference to the drawings, in which:

BRIEF DESCRIPTION OF THE DRAWINGS

Delete the paragraphs beginning at page 5, line 37 to page 8, line 40 and insert the following:

FIGURE 1 is a side elevational view of an illustrative yarn feeder embodying the present invention;

FIG. 2 is an enlarged perspective of the yarn feeder shown in FIG. 1;

FIG. 3 is a diagrammatic depiction of a plurality of yarn feeders, such as shown in FIGS. 1 and 2, disposed on a retaining ring of a textile machine;

FIG. 4 is a side elevational view of an alternative embodiment of yarn feeder embodying the present invention;

FIG. 5 is an enlarged vertical section of the yarn feeder shown in FIG. 4;

FIG. 6 is a perspective of a first or lower housing part of a yarn feeder such as shown in FIGS. 1 or 3;

FIG. 7 is a side view of the housing part shown in FIG. 6;

FIG. 8 is a perspective of a second or upper housing part of the yarn feeder such as shown in FIGS. 1 and 3;

FIG. 9 is an end view of the yarn feeder housing;

FIG. 10 is a side elevational view of the housing of the yarn feeder, shown in partial section in the region of the fastening clamp thereof;

FIG. 11 is a perspective of a yarn brake adapted for mounting on the housing of the illustrated yarn feeder;

FIG. 12 is a perspective of a coupling clamping device for fastening fixtures to the yarn feeder;

FIG. 13 is a perspective of a cover cap for the coupling device shown in FIG. 12;
and

FIG. 14 is a perspective of an alternative embodiment of fastening device for the yarn feeder.

While the invention is susceptible of various modifications and alternative constructions, certain illustrated embodiments thereof have been shown in the drawings and will be described below in detail. It should be understood, however, that there is no intention to limit the invention to the specific forms disclosed, but on the contrary, the intention is to cover all modifications, alternative constructions and equivalents falling within the spirit and scope of the invention.

At page 6, after line 29, insert the following heading:

DETAILED DESCRIPTION OF PREFERRED EMBODIMENTS

Amendments to the paragraphs beginning at page 6, line 30 to page 8, line 39:

Referring now more particularly to FIGS. 1 and 2 of the drawings, there is shown an illustrative yarn feeder 1 embodying the present invention adapted for feeding [Figs. 1 and 2 each show a yarn feeder 1 of the invention, in a side view and a perspective view, respectively. The yarn feeder 1 serves to feed] a yarn 2 to a textile-processing machine, such as a knitting machine. The yarn feeder 1 has a housing 3, which serves as a basic carrier for all the elements of the yarn feeder 1. On one end, the housing 3 is provided with a fastening device 4, which is arranged to support and secure the yarn feeder 1 on a suitable retainer 5, such as a rail or a ring of the textile machine, as depicted[. One such retaining device 5 on the machine is shown] in Fig. 3. By way of example, [it is formed in a known manner by a] the ring [of] my have a rectangular cross section and an electric connection cable laid along its outside. A belt 5a serves to drive all the yarn feeders 1.

As shown in Fig. 5 (in conjunction with a slightly modified embodiment), [the housing is penetrated by] a vertically disposed shaft 6[, which] is rotatably supported in the housing 3 [and disposed approximately vertically]. For bearing purposes, two ball bearings 7, 8 are used, which are held in respective bearing seats 9, 10 of the housing 3.

The shaft 6 on its lower end has a yarn guide drum 12, around which the yarn 2 is wrapped once or multiple times. The yarn guide drum 12 is carried and driven by the shaft 6. To that end, the shaft 6 on its upper end has one or more toothed-belt pulleys 14, 15, which in this case are [supported] rotatably supported on the shaft 6 by ball bearings 16, 17 [in the present exemplary embodiments].

The toothed-belt pulley 14 meshes with the belt 5a, whose lower edge is [suggested] depicted in Fig. 5 by a dot-dashed line. Between the toothed-belt pulleys 14, 15, a displaceable coupling disk 18 is disposed. On both of its flat sides, the disk has toothed coupling rings 21, 22, with which the toothed-belt pulleys 14, 15 can be coupled alternatively with the shaft 6 and thus serve as a drive device for the shaft. The coupling disk 18 is provided with coupling prongs for this purpose.

The housing 3 is preferably constructed in multiple parts. In that case it first has a lower housing part 25, which is shown separately in Figs. 6 and 7. The housing part 55 is a substantially clamshell-like injection molded cart. For forming the fastening device 4, the housing part 25 has a portion 26 in the form of a U in side view, whose jaw opens

downward and whose inner contour is adapted [to] for receiving a fastening rail (retaining device) on the machine. On the legs 26a that define the jaw, lateral protrusions 27 are provided for transmitting an outward-oriented force, which spreads the jaw wider, to the other mating housing cart 33. Thus the leg 26a is the leg that is primarily supported on the retaining device and in turn on a corresponding leg of the housing part 33 (Fig. 9). On the opposite side of the jaw, the conditions are reversed. The leg 26b on that side is supported secondarily, or in other words indirectly on the retaining device. Support cleats 28 act as abutments for corresponding parts (82, Fig. 9) of the corresponding leg of the housing part 33, which comes directly (primarily) into contact with the retaining device.

The fastening device 4 [embodied] is formed on the housing 3 [is embodied] as a fastening clamp by the housing 3; for that purpose, no force-[observing] carrying elements, reinforcing elements or the like of any kind made of material extraneous to the housing are provided. The cross section of the housing 3 in the region of the fastening device 4 can be seen in Fig. 10. The upper housing part 33 and the lower housing part 25 together define a hollow profile, approximating [which is embodied approximately in the manner of] a box profile. [It] The housing 3 can be put together in such a way that the housing part 25, which in the section shown in Fig. 10 is approximately flat, has the upper housing part 33, which here is U-shaped fitting over it. in the interior enclosed by them, reinforcement ribs 33a, 33b, 33c can be provided. As needed, these ribs can also fill the interior almost entirely or entirely. However, relatively narrow ribs, of the kind also seen in Fig. 8, are preferred. The somewhat wider middle rib 33b can, as seen in Fig. 8, in turn be divided into ribs, so that an overly large plastic volume does not occur at any point of the housing part 33[. Overly] excessively great material thickness can thus be avoided.

The hollow profile-like embodiment of the clamp, formed by the two housing parts 25, 33, and the optionally provided inner ribs 33a, 33b, 33c assure adequate rigidity of the fastening device 4 with respect to forces [having the] which have a tendency to spread the jaw wider. The fastening device 4 can thus be made so narrow that it does not protrude laterally past the yarn feeder, or does so at most only slightly, so that as shown in Fig. 3 the yarn feeders 1 have space side by side on the retaining ring 5.

Amendments to the paragraphs beginning at page 9, line 12 to page 10, line 23:

As seen from Fig. 6, at least two metal strips 33, 39, are placed in suitable receptacles in the housing part 25[; they] and are retained in corresponding slits. The metal strip 38, which is in the form of [embodied as] a U-shaped hoop, is for instance connected to ground potential and has notches 41, 42, 43, 44 for the pivotable bearing of an inlet-side yarn feeler 45 and an outlet-side yarn feeler 46 and also has an eyelet 47, in order to make a ground connection with external fixtures. This connection is made particularly [to] with fixtures that come into contact with the yarn 2. Other stationary or moving yarn guide elements may, but need not, be grounded.

The metal strip 39 may lead to switches 48, 49, actuated by the yarn feelers 45, 46, of two separate shutoff current circuits. On its end remote from the switches 48, 49, [it may be embodied as] the strip may define a clamp contact for an electronic component 51. This component may in turn be connected by its other end to a clamp contact of a further conductor 52. For contacting a line provided on the retainer on the machine, windows 53, 54 extending in the region of the fastening device 4 into the housing interior are provided, through which connection elements can reach. In the vicinity of the fastening device, a single indicator light 50 for both shutoff current circuits is disposed, which lights up as soon as one of the switches 48, 49 is actuated, or in other words as soon as one of the yarn sensors has been pivoted downward. The indicator light is inserted into a stamped conductor track.

The upper housing part 33 [can be seen from] is depicted in Figs. 8 and 9[. It is embodied in] has clamshell [fashion] shape and in its interior, it has hollow pegs 61, 62 for receiving the pegs 34, 35 of the lower housing part 25. A recess 63 of circular cross section is provided for receiving the hollow peg 36, and a threaded bore for a fastening screw 64 (see Fig. 5) is provided on its bottom. The bottom is formed, as will be explained hereinafter, by a part [that belongs to] of a coupling device. For adjusting the housing parts 33, 25, and [in particular] particularly to attain adequate alignment of the ball bearings 7, 8 with one another, a suitable seat is embodied in the housing part 33 in order to receive the tubular extension 32. This seat is formed substantially by a stepped bore which is capable of receiving the upper end, [embodied] formed somewhat conically if needed, [of] to the tubular extension 32. For low-play or play-free centering of the free end of the extension 32, axially oriented ribs 66 may be disposed on the circumference of

the approximately cylindrical outer surface of the seat 65. On the outside of the housing part 33, the bearing seat 9 is embodied, coaxially to the seat 65 on the inside.

Amendments to the paragraphs beginning at page 10, line 35 to page 12, line 18:

In the housing 3, and in the present exemplary embodiment in the housing part 33, a feeler barrier 71 is supported longitudinally displaceably; it as can be seen from Figs. 1, 8 and 9. It is formed by a sheet-metal strip whose free end, embodied as a handle 72, protrudes out of the housing part 33. To that end, a depression 73 visible in Fig. 1 is [embodied] formed on the housing part 33, and an angled end of the feeler barrier 71 is disposed in the depression. The feeler barrier 71 is displaceably supported and is profiled in such a way that it pivots first one feeler lever (45) and then the other feeler lever (46) from a freely downward-hanging position into an upper position upon actuation.

As seen particularly from Fig. 12, a jaw-like portion 80 of [is embodied on] the fastening device [4 of the] housing part 33 and can fit over the portion 26 of the lower housing part 25. It has a rear bearing depression 81, into which the protrusions 27 (Fig. 7) off the lower housing part 25 can move. On the opposite side, conversely, a bearing region 82 is formed, which is braced on the support cleats 28 of the lower housing part 25, when it is urged in the region that stretches the jaw open.

Between the housing parts 25, 33, an approximately horizontal dividing seam 83 is formed. The housing parts 25, 33 fit in one another here. Approximately in a rectilinear extension of the dividing seam 83, in the region of the fastening device 4, a coupling clamping device 84 is formed, which is shown separately in Fig. 12[. It is] as a component of the upper housing part 33 [and can be seen in Fig. 12]. It is termed by a flat guide plate 86, connected to the housing part via ribs 85, and its free end has a female-threaded hollow peg 87, which forms the bottom of the recess 63. The hollow peg 87 is carried by the guide plate 36 and protrudes freely into the recess 63. The fastening screw 64 is seated in the hollow peg 37 and holds the two housing parts 25, 33 together, and once it is tightened it deforms the guide plate 85 somewhat. A foot 187, slipped onto the guide plate and having a shape complimentary to the guide plate is firmly clamped thereby. The foot 187 has two cleats 188, 139, which fit with little play into the interstice between the guide plate and the adjacent housing face period. When the guide plate 86 is

deformed, the foot 187 clamps. In Fig. 4 and Fig. 9, a cover cap 89 is thereby retained; this cap [is] being shown separately in Fig. 13. As needed, however, this cap can be removed and replaced with a retaining hoop 90, as shown in Fig. 1 or Fig. 2. By way of example, the retaining hoop can carry yarn guide means, such as a tubule 91. The retainer hoop 90 can fit over the toothed-belt pulleys 14, 15[. Its] with its clamping retainer [is] being disposed in the immediate vicinity of the fastening 4.

For secure fastening of the ball bearings 7, 8 and the bearing seats 9, 10, elastomer elements are disposed between the respective ball bearings 7, 8 and the bearing seat 9, 10. The bearing seats 9, 10 preferably are provided on the inside with [preferably] longitudinal ribs or regions protruding in other ways, so that the elastomer elements, in the region off the longitudinal ribs, are compressed somewhat between the outer bearing ring and the rib. The elastomer elements have a compensatory effect for temperature changes, shrinking from aging, and production variations.

Amendments to the paragraphs beginning at page 12, line 31 to page 13, line 20:

While the yarn guide element 96 is embodied as a hook and is retained non-displaceably, the yarn guide eyelet 97 may be adjustable [is preferably embodied adjustably], as an antifulmentation device. For instance, the yarn guide eyelet 97 may be embodied as a wire hoop, whose two ends have a foot that is [supported] displaceably supported on the housing 3. To that end, the lower housing part has one pocket 98, visible in Fig. 8, on both sides, the pocket having vertical end faces. The upper housing part 33 (Fig. 8) has cheeks 101, 102, which are associated with the pockets 98 and are profiled on their inside in such a way that on both sides of the pockets 98 they have guide grooves 103, 104, into which the wire hoop can snap. For adjustment purposes, the hoop can thus be compressed and transferred out of the guide groove 103 into the guide groove 104, and vice versa. The lower free end of the hoop, forming an eyelet, can thus be transferred front a first position, in which it is located virtually at the same level as the lower rim or the yarn guide drum but spaced apart from this drum, to a second position in which it is located relatively far below the lower rim but horizontally closer to it.

Optionally, a yarn brake 105, which may be driven, is provided on the yarn feeder 1. As needed, a non-driven yarn brake can also be provided. The yarn brake 105

has two rings 106, 107, visible particularly from Fig. 11, which each have one inner and one outer rim; the rims of the two rings 106, 107 are curved away from one another. Permanent magnets 108 [tense] urge the rings 106, 107 elastically against one another.

Amendments to the paragraph at page 13, line 27:

The wire hoop 112 has two hoops 116, 117, which carry the guide element 111 and the rings 106, 107. The legs are supported longitudinally displaceably in a guide part 118. The leg 117 has an end bent inward, that is, toward the rings 106, 107, on which end an intermediate element 120 is held, being braced on the guide element 118 via a helical spring 119 or other kind of spring. The other leg 116 is approximately aligned with the free end of the leg 117 but is bent away from it. The end has a tappet 121, which [may] also may be formed by a cap-shaped plastic part.

Amendments to the paragraphs beginning at page 16, line 20 to page 17, line 7:

A modified embodiment of the yarn feeder 1 is shown in Fig. 4. It differs from the above-described yarn feeder 1 in terms of the embodiment of the fastening device 4. The fastening device is provided, on the side remote from the jaw, with reinforcing ribs 33a', 33b', 33c', which belong to the housing part 33 and whose special feature is that they protrude front the level that is defined by the lower edge of the drive belt [and is suggested in] as indicated in the dot-dashed lines Fig. 14. The wall thickness of the ribs 33a', 33b', 33c' is overly great and is substantially less than their respective height. This makes the fastening device 4 so resistant to widening forces that it is possible to dispense with introduction elements, metal inlays or other stiffening additional elements in the clams. Only the nut 140 visible in Fig. 5 is needed. Other metal elements can be omitted.

[The] From the foregoing, it can be seen that the yarn feeder 1 of the invention has a plastic housing 3, preferably made of two clamshells. For connection to a retainer on the machine, a fastening device 4 is provided that also is made of plastic. The fastening device 4 is made rigid by suitable shaping which may eliminate the necessity for [and makes do without] metal inlays. The two halves of the housing each have one bearing for a continuous shaft, which on one end carries a yarn guide drum and on its other end carries pulleys 14, 15, for instance, as a drive device. Fastening means serve to

hold the two housing parts together in the correct position. The housing 3 is easy to open for maintenance purposes.

IN THE CLAIMS:

Cancel claims 1-15 and substitute therefore the following new claims 16-40:

16. (New) A yarn feeder (1) particularly adapted for use in textile machines comprising:

a housing (3) having a fastening clamp (4) for securing the yarn feeder to a retaining device of a textile machine;

said housing (3) being made of plastic;

said fastening clamp (4) having a box-like cross-sectional profile with portions that incur clamping forces when said fastening clamp is fastened to a retaining device; and

said fastening clamp portions being formed entirely of the plastic material of said housing.

17. (New) The yarn feeder of claim 16 in which said fastening clamp (4) has a jaw for receiving the retaining device on the textile machine.

18. (New) The yarn feeder of claim 17 in which said housing has two parts (25, 33), and said jaw is formed on one of the housing parts (25, 33).

19. (New) The yarn feeder of claim 17 in which the housing pads (25, 33) fit over one another in the region of the fastening device (4), and said housing parts (25, 33) are joined together by at least one support (27, 28) in the region of the fastening device (4).

20. (New) The yarn feeder of claim 16 including a coupling device (86) for connecting at least one further housing component (89, 90) as required on the housing (3).

21. (New) The yarn feeder of claim 20 in which said coupling device (86) is disposed above the fastening clamp (4).

22. (New) The yarn feeder of claim 16 in which the housing (3) has receptacles

into which metal elements (38, 39) are disposed and which serve as conductor tracks for electrical components associated with the yarn feeder.

23. (New) The yarn feeder of claim 16 in which an electrically grounded conductor is disposed within the housing and is connected to at least one metal element (95) that is in contact with yarn being fed by the yarn feeder.

24. (New) The yarn feeder of claim 23 including movable yarn sensor elements (45) supported on the metal elements.

25. (New) The yarn feeder of claim 16 in which the box-like cross-sectional profile of the fastening device (4) has an interior that includes ribs (33a', 33b', 33c') disposed in parallel relation to each other.

26. (New) A yarn feeder (1) particularly adapted for use in textile machines comprising:

a housing (3) having a plastic fastening clamp (4) for fastening to a retaining device of a textile machine;

a shaft (6) extending through said housing (3);

a yarn guide drum (12) mounted adjacent an end of said shaft;

a drive for rotating said shaft and yarn guide drum; said drive including at least one pulley (14) carried on said shaft and a drive belt for driving said pulley, said at least one pulley and drive belt being in spaced relation to one side of said yarn guide drum; and

said fastening clamp (4) having portions (33a', 33b', 33c') extending beyond a plane defined by an edge of the drive belt on a yarn guide drum side of the belt.

27. (New) The yarn feeder of claim 26 in which said fastening clamp (4) has a jaw for receiving the retaining device on the textile machine.

28. (New) The yarn feeder of claim 27 in which said housing is in two parts, and said jaw is formed on one of the housing parts (25, 33).

29. (New) The yarn feeder of claim 26 in which the housing parts (25, 33) fit over one another in the region of the fastening clamp (4), and said housing parts (25, 33) are joined together by at least one support (27, 28) in the region of the fastening device (4).

30. (New) The yarn feeder of claim 26 including a coupling device (86) disposed above the fastening clamp (4) for connecting a further component (89, 90) onto the housing.

31. (New) The yarn feeder of claim 26 in which the housing (3) has receptacles into which metal elements (38, 39) are disposed and which serve as conductor tracks for electrical components associated with the yarn feeder.

32. (New) A yarn feeder(1) particularly adapted for use in textile machines comprising:

a housing (3) having a fastening clamp (4) for fastening to a retaining device of a textile machine;

a shaft (6) extending through said housing (3), a yarn guide drum (4) mounted adjacent an end of said shaft, a drive device(14) connected to another end of said shaft;

yarn guides (95a, 97) for defining a yarn travel path toward and away from the yarn guide drum (12); at least two bearings (7, 8) for rotatably supporting said shaft (6);

said housing (3) having at least one first housing part (25) oriented toward said yarn guide drum (12) and having a bearing seat (10) for one of said bearings (8);

said housing (3) having at least one second housing part (33) oriented toward the drive device (14) and having a seat for the other bearing (7); and

at least one connector (64) for connecting the housing parts (25, 33) together in properly positioned relation.

33. (New) The yarn feeder of claim 32 in which said housing (3) has a substantially horizontal dividing seam (83) between said housing parts (25, 33), and said housing parts (25, 33) have alignment members (32, 34, 35) which locate the housing parts (25, 33) in proper positionable relation to each other.

34. (New) The yarn feeder of claim 32 in which said bearings (7, 8) are ball

bearings, and said bearing seats (9, 10) are tubular members pointing away from each other integrally formed in the housing parts (25, 33).

35. (New) The yarn feeder of claim 34 in which one of said tubular portions is oriented toward the yarn guide drum (12) and extends into an interior defined by the yarn guide drum (12).

36. (New) The yarn feeder of claim 33 including elastomer bearing receiving elements disposed between the bearing seats (9, 10) and the bearings (7, 8), and said bearing seats (9, 10) have interrupted bearing faces protruding radially inward in the direction toward the bearings (7, 8).

37. (New) The yarn feeder of claim 32 in which said fastening clamp (4) has a jaw for receiving the retaining device on the textile machine.

38. (New) The yarn feeder of claim 32 in which said housing is made of plastic.

39. (New) The yarn feeder of claim 38 in which an electrically grounded conductor is disposed within the housing and is connected to at least one metal element (95) that is in contact with yarn being fed by the yarn feeder.

40. (New) The yarn feeder of claim 39 including movable sensor elements (45) are supported on the metal elements.

AMENDMENTS TO THE ABSTRACT:

Delete the heading and abstract and substitute the following:

ABSTRACT OF THE DISCLOSURE

The yarn feeder having a plastic housing, preferably made of two clamshells, with a plastic fastening device for connecting the yarn feeder to a retaining device of a textile machine. The fastening device is made rigid by suitable shaping and without the necessity for metal inlays. The two clamshell halves of the housing each have a bearing for a

continuous shaft, which on one end carries a yarn guide drum and on its other end carries pulleys for a drive device. Fasteners serve to hold the two housing parts together in the correct position for enabling easy opening of the housing for maintenance.

PENDING CLAIMS AFTER ENTRY OF PRELIMINARY AMENDMENT

16. A yarn feeder (1) particularly adapted for use in textile machines comprising:
a housing (3) having a fastening clamp (4) for securing the yarn feeder to a retaining
device of a textile machine;

said housing (3) being made of plastic;

said fastening clamp (4) having a box-like cross-sectional profile with portions that
incur clamping forces when said fastening clamp is fastened to a retaining device; and

said fastening clamp portions being formed entirely of the plastic material of said
housing.

17. The yarn feeder of claim 16 in which said fastening clamp (4) has a jaw for
receiving the retaining device on the textile machine.

18. The yarn feeder of claim 17 in which said housing has two parts (25, 33), and
said jaw is formed on one of the housing parts (25, 33).

19. The yarn feeder of claim 17 in which the housing pads (25, 33) fit over one
another in the region of the fastening device (4), and said housing parts (25, 33) are joined
together by at least one support (27, 28) in the region of the fastening device (4).

20. The yarn feeder of claim 16 including a coupling device (86) for connecting at

least one further housing component (89, 90) as required on the housing (3).

21. The yarn feeder of claim 20 in which said coupling device (86) is disposed above the fastening clamp (4).

22. The yarn feeder of claim 16 in which the housing (3) has receptacles into which metal elements (38, 39) are disposed and which serve as conductor tracks for electrical components associated with the yarn feeder.

23. The yarn feeder of claim 16 in which an electrically grounded conductor is disposed within the housing and is connected to at least one metal element (95) that is in contact with yarn being fed by the yarn feeder.

24. The yarn feeder of claim 23 including movable yarn sensor elements (45) supported on the metal elements.

25. The yarn feeder of claim 16 in which the box-like cross-sectional profile of the fastening device (4) has an interior that includes ribs (33a', 33b', 33c') disposed in parallel relation to each other.

26. A yarn feeder (1) particularly adapted for use in textile machines comprising:

- a housing (3) having a plastic fastening clamp (4) for fastening to a retaining device of a textile machine;

- a shaft (6) extending through said housing (3);

- a yarn guide drum (12) mounted adjacent an end of said shaft;

- a drive for rotating said shaft and yarn guide drum; said drive including at least one pulley(14) carried on said shaft and a drive belt for driving said pulley, said at least one pulley and drive belt being in spaced relation to one side of said yarn guide drum; and

- said fastening clamp (4) having portions (33a' 33b, 33c') extending beyond a plane defined by an edge of the drive belt on a yarn guide drum side of the belt.

27. The yarn feeder of claim 26 in which said fastening clamp (4) has a jaw for receiving the retaining device on the textile machine.

28. The yarn feeder of claim 27 in which said housing is in two parts, and said jaw is formed on one of the housing parts (25, 33).

29. The yarn feeder of claim 26 in which the housing parts (25, 33) fit over one another in the region of the fastening clamp (4), and said housing parts (25, 33) are joined together by at least one support (27, 28) in the region of the fastening device (4).

30. The yarn feeder of claim 26 including a coupling device (86) disposed above the fastening clamp (4) for connecting a further component (89, 90) onto the housing.

31. The yarn feeder of claim 26 in which the housing (3) has receptacles into which metal elements (38, 39) are disposed and which serve as conductor tracks for electrical components associated with the yarn feeder.

32. A yarn feeder(1) particularly adapted for use in textile machines comprising:
a housing (3) having a fastening clamp (4) for fastening to a retaining device of a textile machine;

a shaft (6) extending through said housing (3), a yarn guide drum (4) mounted adjacent an end of said shaft, a drive device(14) connected to another end of said shaft;
yarn guides (95a, 97) for defining a yarn travel path toward and away from the yarn guide drum (12); at least two bearings (7, 8) for rotatably supporting said shaft (6);

said housing (3) having at least one first housing part (25) oriented toward said yarn guide drum (12) and having a bearing seat (10) for one of said bearings (8);

said housing (3) having at least one second housing part (33) oriented toward the drive device (14) and having a seat for the other bearing (7); and

at least one connector (64) for connecting the housing parts (25, 33) together in properly positioned relation.

33. The yarn feeder of claim 32 in which said housing (3) has a substantially

horizontal dividing seam (83) between said housing parts (25, 33), and said housing parts (25, 33) have alignment members (32, 34, 35) which locate the housing parts (25, 33) in proper positionable relation to each other.

34. The yarn feeder of claim 32 in which said bearings (7, 8) are ball bearings. and said bearing seats (9, 10) are tubular members pointing away from each other integrally formed in the housing parts (25, 33).

35. The yarn feeder of claim 34 in which one of said tubular portions is oriented toward the yarn guide drum (12) and extends into an interior defined by the yarn guide drum (12).

36. The yarn feeder of claim 33 including elastomer bearing receiving elements disposed between the bearing seats (9, 10) and the bearings (7, 8), and said bearing seats (9, 10) have interrupted bearing faces protruding radially inward in the direction toward the bearings (7, 8).

37. The yarn feeder of claim 32 in which said fastening clamp (4) has a jaw for receiving the retaining device on the textile machine.

38. The yarn feeder of claim 32 in which said housing is made of plastic.

39. The yarn feeder of claim 38 in which an electrically grounded conductor is disposed within the housing and is connected to at least one metal element (95) that is in contact with yarn being fed by the yarn feeder.

40. The yarn feeder of claim 39 including movable sensor elements (45) are supported on the metal elements.

YARN FEEDER FOR TEXTILE MACHINES

The invention relates to a yarn feeder having the characteristics of the preamble to claim 1, 2 or 3.

5 Yarn feeders are vendor parts for textile machines and particularly in loop-forming textile machines are often found in great numbers thereon. The yarn feeders each feed one yarn to a yarn-using station, such as a knitting station. The quality of the knitted goods
10 produced depends decisively on the precision and reliability of the yarn feeders. On the one hand, this makes demands in terms of precision - yet on the other the yarn feeders should be as simply embodied, economical, and simple to make and maintain as possible.
15 Furthermore, they must reliably perform their function even if they are operated for relatively long periods without special maintenance and in particular without cleaning. Deposits of dust or fluff must not impair operation.

20 The goal is also to design a yarn feeder such that it can be adapted in a simple way to different kinds of use.

In the industry, yarn feeders are known that have a metal housing, which on one end has a clamping device for
25 fastening to a yarn-using machine, such as a knitting machine. The housing forms a retainer for two ball bearings, which are disposed on the side of the housing remote from the fastening device. The ball bearings rotatably support a vertically disposed shaft, which on
30 its lower end has a yarn guide drum and on its upper end has one or more toothed-belt pulleys. The toothed-belt pulleys can be coupled to the shaft via a displaceable coupling disk.

A yarn brake and a plurality of yarn guide elements
35 are disposed upstream of the yarn guide drum. Further yarn guide elements are disposed downstream of the yarn guide drum. In addition, a shutoff lever and a yarn feeler lever are pivotably supported on the housing and actuate switches disposed in the interior of the housing
40 in order to indicate a yarn break and to shut off the

textile machine if necessary. For contacting a suitable electric line, connection means are provided on the fastening device, from which means electric lines lead to the appropriate switches in the interior of the housing.

- 5 A signal light is also disposed on the yarn feeder and signals an error state accordingly.

These yarn feeders have proven themselves in practice. However, they require a certain expense for production.

- 10 It is the object of the invention to reduce this expense.

This object is attained by a yarn feeder that has the characteristics of claim 1, 2 or 3.

- 15 In its embodiment according to claims 1 and 2, the yarn feeder has a plastic housing. The fastening clamp is also embodied of plastic. The special design of the fastening clamp according to claim 1 or 2 allows such a narrow design of this clamp, with the required stiffness and strength, that the retaining devices can be mounted
20 on the retaining ring of a textile machine without the fastening clamps being a hindrance to each other. To that end, the invention provides on the one hand the possibility of embodying the jaw-like clamp on or in a box profile-like housing portion. Alternatively, the jaw-like clamp can be provided with reinforcement ribs, on
25 its side pointing away from the jaw, which also furnish the desired strength if they extend relatively far upward, or in other words away from the retaining ring of the textile machine. On the textile machines, the spacing
30 between the retaining ring and a drive belt for driving the yarn feeders is usually structurally specified by the construction and defined uniformly. It has been found that the reinforcing ribs are adequately large if, viewed from the retaining ring, they protrude past the plane
35 defined by the lower edge of the belt. In this way, it becomes possible for the yarn feeders with the yarn guide drum, which are used to feed the yarns, for instance to knitting stations of a circular knitting machine and which must be relatively narrow in structure, to be
40 embodied of plastic with regard to the housing of the

fastening clamp. The not inconsiderable forces that in particular engage the yarn feeders and are caused by the revolving drive belt are thus reliably absorbed and dissipated.

5 The yarn feeder, according to claim 3, has a housing with at least 2 housing parts, each of which has one bearing means for the continuous shaft. Thus both housing parts, embodied in clamshell fashion, jointly conduct the incident support forces of the bearing means
10 to the fastening device and thus to the textile machine, which acts as a stationary bearing for the yarn feeder. This in turn makes it possible to divide the housing over a large area, so that in the dismantled state, unhindered access to the housing interior is possible. Once the two
15 housing parts are put together, they are joined together positionally correctly by a connecting means, and as a result the housing is closed. Assembly is relatively quite uncomplicated. The dividing seam between the housing parts is preferably disposed substantially
20 horizontally or slightly inclined, so that at least outside the fastening device, it extends along the side faces of the housing. This makes the interior of the housing parts easily accessible. In assembly, parts to be disposed in the interior can simply be introduced into
25 it. This further simplifies assembly.

As the bearing means, ball bearings are preferably provided, which are received in appropriate bearing seats of the housing parts. As the bearing seats, tubular extensions can for instance be provided, which are
30 embodied on the housing parts and extend outward away from them. The ball bearings are preferably introduced from outside into the bearing seats. In a preferred embodiment, the lower bearing seat, toward the yarn guide drum, extends into the yarn guide drum. This maximized
35 the spacing between the two ball bearings, resulting in good support of the shaft with little play. To drive the shaft and the yarn guide drum, a plurality of toothed-belt pulleys or other kinds of pulleys can be disposed on the other end of the shaft as needed, with a belt
40 traveling along the pulleys. The resultant support forces

on the ball bearing are readily absorbed by the wide support spacing.

Also by means of the bearing seat extending into the yarn guide drum, it is attained that in the event of an error a yarn will not be wound onto the shaft, and this increases the operational safety.

The upper bearing seat can extend into the inside of a pulley, in order to maximize the spacing from the lower bearing seat as much as possible. In this case, both bearing seats are located outside the housing; the tubular extensions protrude upward and downward away from the housing.

In an advantageous embodiment, bearing receiving elements of elastomer are disposed in the bearing seats. These bearing receiving elements secure the ball bearings in the bearing seat. The bearing seats, on their inside face which is otherwise for instance cylindrical, are preferably provided with longitudinal ribs, which press into the bearing receiving elements. This provision makes it possible to press the bearings into the bearing seats with only slight axial forces and to secure them permanently there. This is true in particular even if the dimensions of the bearing seat should change or fluctuate somewhat because of production variations or temperature changes and aging.

The fastening device on the machine is formed for instance by a jaw-like clamp, which is embodied on at least one of the housing parts. The housing parts are preferably, however, embodied fitting over one another in the region or the fastening device, so that each housing part and thus each bearing seat is joined to the fastening device in a way that directly transmits force. This makes good absorption of the retaining forces by the housing and good transmission of the support forces to the fastening device and the retaining device possible. To reinforce this, the housing parts in one embodiment are joined together in the region of the fastening device by at least one support means. The jaw of the fastening device can then be embodied such that on one side, one housing part has a bearing and clamping face, while on

the opposite flank or side the other housing part defines the bearing and clamping face. As a result, when the fastening device is clamped firmly by means of a clamping screw that is braced on one leg and disoriented

- 5 perpendicular to the clamping face, both housing parts are braced against one another.

A coupling device for fastening at least one further housing part may be embodied or provided on the housing. As a result, additional elements can be secured
10 to the housing, which makes the yarn feeder even more versatile. The coupling device is preferably a clamp coupling with a guide that can be tightened.

In a preferred embodiment, the housing parts are embodied as electrically insulating, at least on their
15 inside. Preferably, however, the housing is made either entirely or in part of plastic. This affords the possibility of placing electrical conductor tracks, as metal elements, in suitable receptacles of the housing without special insulation. The metal elements can
20 perform a dual function, by acting at the same time as bearings for other common moveable elements, such as electric switches, shutoff means, yarn feelers, or the like.

If the yarn feeder housing is made of plastic, then
25 possible electrostatic charges, which the running yarn sliding along the yarn guide elements could cause, can be counteracted by grounding of at least one, preferably stationary yarn guide element. Thus fluff deposits can be reduced, and other harmful effects of static charges can
30 be reduced or prevented. The grounding can be done by means of an electric conductor connected to ground and disposed in the housing, if this conductor is connected to at least one element that is electrically conductive and is in contact with the yarn. The plastic housing can
35 comprise entirely insulating material or electrically weakly conductive plastic.

Advantageous details of embodiments of the invention will become apparent from the drawing, description or dependent claims.

40 Exemplary embodiments of the invention are shown in

the drawing. Shown are:

30 Figs. 1 and 2 each show a yarn feeder 1 of the invention, in a side view and a perspective view, respectively. The yarn feeder 1 serves to feed a yarn 2 to a textile-processing machine, such as a knitting machine. The yarn feeder 1 has a housing 3, which serves
35 as a basic carrier for all the elements of the yarn feeder 1. On one end, the housing 3 is provided with a fastening device 4, which is arranged to support and secure the yarn feeder 1 on a suitable retainer 5, such as a rail or a ring of the textile machine. One such
40 retaining device 5 on the machine is shown in Fig. 3. By

way of example, it is formed in a known manner by a ring of rectangular cross section and an electric connection cable laid along its outside. A belt 5a serves to drive all the yarn feeders 1.

5 As shown in Fig. 5 (in conjunction with a slightly modified embodiment), the housing is penetrated by a shaft 6, which is rotatably supported in the housing 3 and disposed approximately vertically. For bearing purposes, two ball bearings 7, 8 are used, which are held
10 in respective bearing seats 9, 10 of the housing 3.

The shaft 6 on its lower end has a yarn guide drum 12, around which the yarn 2 is wrapped once or multiple times. The yarn guide drum 12 is carried and driven by the shaft 6. To that end, the shaft 6 on its upper end
15 has one or more toothed-belt pulleys 14, 15, which are supported rotatably on the shaft 6 by ball bearings 16, 17 in the present exemplary embodiments.

The toothed-belt pulley 14 meshes with the belt 5a, whose lower edge is suggested in Fig. 5 by a dot-dashed
20 line. Between the toothed-belt pulleys 14, 15, a displaceable coupling disk 18 is disposed. On both of its flat sides, the disk has toothed coupling rings 21, 22, with which the toothed-belt pulleys 14, 15 can be coupled alternatively with the shaft 6 and thus serve as a drive
25 device for the shaft. The coupling disk 18 is provided with coupling prongs for this purpose.

The housing 3 is preferably constructed in multiple parts. In that case it first has a lower housing part 25, which is shown separately in Figs. 6 and 7. The housing
30 part 55 is a substantially clamshell-like injection molded cart. For forming the fastening device 4, the housing part 25 has a portion 26 in the form of a U in side view, whose jaw opens downward and whose inner contour is adapted to a fastening rail (retaining device)
35 on the machine. On the legs 26a that define the jaw, lateral protrusions 27 are provided for transmitting an outward-oriented force, which spreads the jaw wider, to the other housing cart 33. Thus the leg 26a is the leg that is primarily supported on the retaining device and
40 in turn on a corresponding leg of the housing part 33

(Fig. 9). On the opposite side of the jaw, the conditions are reversed. The leg 26b on that side is supported secondarily, or in other words indirectly on the retaining device. Support cleats 28 act as abutments for corresponding parts (82, Fig. 9) of the corresponding leg of the housing part 33, which comes directly (primarily) into contact with the retaining device.

The fastening device 4 embodied on the housing 3 is embodied as a fastening clamp by the housing 3; for that purpose, no force-observing elements, reinforcing elements or the like of any kind made of material extraneous to the housing are provided. The cross section of the housing 3 in the region of the fastening device 4 can be seen in Fig. 10. The upper housing part 33 and the lower housing part 25 together define a hollow profile, which is embodied approximately in the manner of a box profile. It can be put together in such a way that the housing part 25, which in the section shown in Fig. 10 is approximately flat, has the upper housing part 33, which here is U-shaped fitting over it. In the interior enclosed by them, reinforcement ribs 33a, 33b, 33c can be provided. As needed, these ribs can also fill the interior almost entirely or entirely. However, relatively narrow ribs, of the kind also seen in Fig. 8, are preferred. The somewhat wider middle rib 33b can, as seen in Fig. 8, in turn be divided into ribs, so that an overly large plastic volume does not occur at any point of the housing part 33. Overly great material thickness can thus be avoided.

The hollow profile-like embodiment of the clamp, formed by the two housing parts 25, 33, and the optionally provided inner ribs 33a, 33b, 33c assure adequate rigidity of the fastening device 4 with respect to forces having the tendency to spread the jaw wider. The fastening device 4 can thus be made so narrow that it does not protrude laterally past the yarn feeder, or does so at most only slightly, so that as shown in Fig. 3 the yarn feeders 1 have space side by side on the retaining ring 5.

On its underside, the clamshell-like housing part

25 has a tubular extension 31, which in the inside forms the bearing seat 10. In the opposite direction, a further tubular attachment 32 extends through the interior of the housing 3 vertically upward in order to align the housing part 25 with respect to a second, upper housing part 33. For further alignment, two pegs 34, 35 adjacent to the tubular attachment 32 are used, which protrude vertically upward from the bottom of the housing part 25. In the region of the fastening device 4, a further peg 36 is provided, which furthermore has an opening for a fastening screw.

As seen from Fig. 6, at least two metal strips 33, 39, are placed in suitable receptacles in the housing part 25; they are retained in corresponding slits. The metal strip 38, embodied as a U-shaped hoop, is for instance connected to ground potential and has notches 41, 42, 43, 44 for the pivotable bearing of an inlet-side yarn feeler 45 and an outlet-side yarn feeler 46 and also has an eyelet 47, in order to make a ground connection with external fixtures. This connection is made particularly to fixtures that come into contact with the yarn 2. Other stationary or moving yarn guide elements may, but need not, be grounded.

The metal strip 39 may lead to switches 48, 49, actuated by the yarn feelers 45, 46, of two separate shutoff current circuits. On its end remote from the switches 48, 49, it may be embodied as a clamp contact for an electronic component 51. This component may in turn be connected by its other end to a clamp contact of a further conductor 52. For contacting a line provided on the retainer on the machine, windows 53, 54 extending in the region of the fastening device 4 into the housing interior are provided, through which connection elements can reach. In the vicinity of the fastening device, a single indicator light 50 for both shutoff current circuits is disposed, which lights up as soon as one of the switches 48, 49 is actuated, or in other words as soon as one of the yarn sensors has been pivoted downward. The indicator light is inserted into a stamped conductor track.

The upper housing part 33 can be seen from Figs. 8 and 9. It is embodied in clamshell fashion and in its interior, it has hollow pegs 61, 62 for receiving the pegs 34, 35 of the lower housing part 25. A recess 63 of circular cross section is provided for receiving the hollow peg 36, and a threaded bore for a fastening screw 64 (see Fig. 5) is provided on its bottom. The bottom is formed, as will be explained hereinafter, by a part that belongs to a coupling device. For adjusting the housing parts 33, 25, and in particular to attain adequate alignment of the ball bearings 7, 8 with one another, a suitable seat is embodied in the housing part 33 in order to receive the tubular extension 32. This seat is formed substantially by a stepped bore which is capable of receiving the upper end, embodied somewhat conically if needed, of the tubular extension 32. For low-play or play-free centering of the free end of the extension 32, axially oriented ribs 66 may be disposed on the circumference of the approximately cylindrical outer surface of the seat 65.

On the outside of the housing part 33, the bearing seat 9 is embodied, coaxially to the seat 65 on the inside.

Also embodied in the upper housing part 33 are receptacles for electrical contact means, such as two electrical conductors 67, 68, which have ends 69, 70 tapering to a point. The ends 69, 70 protrude into the region of the fastening 4 and are disposed and retained in such a way that they protrude through the windows 53, 54 (Fig. 6) as can be seen particularly from Fig. 8 or Fig. 4. The contact with the contact strips of the lower housing part 25 is made automatically when the housing 3 is put together, for instance in that these strips press resiliently against the conductors 67, 68.

In the housing 3, and in the present exemplary embodiment in the housing part 33, a feeler barrier 71 is supported longitudinally displaceably; it can be seen from Figs. 1, 8 and 9. It is formed by a sheet-metal strip whose free end, embodied as a handle 72, protrudes out of the housing part 33. To that end, a depression 73

visible in Fig. 1 is embodied on the housing part 33, and an angled end of the feeler barrier 71 is disposed in the depression. The feeler barrier 71 is displaceably supported and is profiled in such a way that it pivots first one feeler lever (45) and then the other feeler lever (46) from a freely downward-hanging position into an upper position upon actuation.

As seen particularly from Fig. 12, a jaw-like portion 80 is embodied on the fastening device 4 of the housing part 33 and can fit over the portion 26 of the lower housing part 25. It has a rear bearing depression 81, into which the protrusions 27 (Fig. 7) of the lower housing part 25 can move. On the opposite side, conversely, a bearing region 82 is formed, which is braced on the support cleats 28 of the lower housing part 25, when it is urged in the region that stretches the jaw open.

Between the housing parts 25, 33, an approximately horizontal dividing seam 83 is formed. The housing parts 25, 33 fit in one another here. Approximately in a rectilinear extension of the dividing seam 83, in the region of the fastening 4, a coupling clamping device 84 is formed, which is shown separately in Fig. 12. It is a component of the upper housing part 33 and can be seen in Fig. 12. It is termed by a flat guide plate 86, connected to the housing part via ribs 85, and its free end has a female-threaded hollow peg 87, which forms the bottom of the recess 63. The hollow peg 87 is carried by the guide plate 36 and protrudes freely into the recess 63. The fastening screw 64 is seated in the hollow peg 37 and holds the two housing parts 25, 33 together, and once it is tightened it deforms the guide plate 85 somewhat. A foot 187, slipped onto the guide plate and having a shape complementary to the guide plate is firmly clamped thereby. The foot 187 has two cleats 188, 139, which fit with little play into the interstice between the guide plate and the adjacent housing face period. When the guide plate 86 is deformed, the foot 187 clamps. In Fig. 4 and Fig. 9, a cover cap 89 is thereby retained; this cap is shown separately in Fig. 13. As needed, however,

this cap can be removed and replaced with a retaining hoop 90, as shown in Fig. 1 or Fig. 2. By way of example, the retaining hoop can carry yarn guide means, such as a tubule 91.

5 The retainer 90 can fit over the toothed-belt pulleys 14, 15. Its clamping retainer is disposed in the immediate vicinity of the fastening 4.

For secure fastening of the ball bearings 7, 8 and the bearing seats 9, 10, elastomer elements are disposed
10 between the respective ball bearings 7, 8 and the bearing seat 9, 10. The bearing seats 9, 10 are provided on the inside with preferably longitudinal ribs or regions protruding in other ways, so that the elastomer elements, in the region off the longitudinal ribs, are compressed
15 somewhat between the outer bearing ring and the rib. The elastomer elements have a compensatory effect for temperature changes, shrinking from aging, and production variations.

The housing parts 25, 33 are held against one
20 another by the fastening screw 64 and by other fastening screws 93a, 93b. These fastening screws 93a, 93b can also serve to hold further elements, such as yarn guiding elements 94 or a knot catcher 95 (see Fig. 5) against the housing 3, the knot catcher being electrically connected
25 to the eyelet 47 of the grounded. metal strip 33. Immediately upstream of the yarn guide drum 12, a further yarn guide 95a may be provided, which is retained against an extension off the lower housing part 25. Following the yarn guide drum, further yarn guide elements 96, 97 may
30 be disposed.

While the yarn guide element 96 is embodied as a hook and is retained non-displaceably, the yarn guide eyelet 97 is preferably embodied adjustably, as an antifilamentation device. For instance, the yarn guide
35 eyelet 97 may be embodied as a wire hoop, whose two ends have a foot that is supported displaceably on the housing 3. To that end, the lower housing part has one pocket 98, visible in Fig. 8, on both sides, the pocket having vertical end faces. The upper housing part 33 (Fig. 8)
40 has cheeks 101, 102, which are associated with the

pockets 98 and are profiled on their inside in such a way that on both sides of the pockets 98 they have guide grooves 103, 104, into which the wire hoop can snap. For adjustment purposes, the hoop can thus be compressed and transferred out of the guide groove 103 into the guide groove 104, and vice versa. The lower free end of the hoop, forming an eyelet, can thus be transferred front a first position, in which it is located virtually at the same level as the lower rim or the yarn guide drum but spaced apart from this drum, to a second position in which it is located relatively far below the lower rim but horizontally closer to it.

Optionally, a yarn brake 105, which may be driven, is provided on the yarn feeder 1. As needed, a non-driven yarn brake can also be provided. The yarn brake 105 has two rings 106, 107, visible particularly from Fig. 11, which each have one inner and one outer rim; the rims of the two rings 106, 107 are curved away from one another. Permanent magnets 108 tense the rings 106, 107 elastically against one another.

The rings 106, 107 have a relatively large central opening 109, through which a wire rib 110 extends. This wire rib is supported in a plastic guide element 111, which is locked with a wire hoop 112 and has a leg 114 extending below the rings 106, 107 (in Fig. 11, the yarn brake 105 is shown standing on its head)

The wire hoop 112 has two hoops 116, 117, which carry the guide element 111 and the rings 106, 107. The legs are supported longitudinally displaceably in a guide part 118. The leg 117 has an end bent inward, that is, toward the rings 106, 107, on which end an intermediate element 120 is held, being braced on the guide element 118 via a helical spring 119 or other kind of spring. The other leg 116 is approximately aligned with the free end of the leg 117 but is bent away from it. The end has a tappet 121, which may also be formed by a cap-shaped plastic part.

The guide element 118 is preferably a plastic element, with a base 122 and a cap 123 that are joined together via a film hinge 124. Detent means, in the form

of a rib 125 embodied on the free end 125 of the base 122 and an undercut 126 embodied on the cap 123, allow the base 122 and cap 123 to be secured to one another. This fixes the hoop 112 in such a way that it is now only axially displaceable and otherwise is retained. The yarn brake 105 is thus a fixture module that is simple to put together and connect.

For receiving the thus-formed brake unit, a pocket 130 is formed on the housing 3, preferably on the upper housing part 33. This pocket may be provided with guides, so that the yarn brake 105 can be introduced into this pocket in guided fashion like a drawer. The fastening screw 93b can act as a securing means that prevents the brake unit from sliding out of the pocket. Alternatively, detent means may be provided.

As seen from Fig. 5, the tappet 121 reaches through a recess 132 (see Fig. 6) provided in the extension 32. A protrusion or cam, not shown in detail, provided on the shaft 6 can be disposed in such a way that upon each revolution of the shaft 6, it transmits a pulse to the tappet 121 and thus to the yarn brake 105. Alternatively, a reducing gear or a shifting gear, similar to a speedometer drive, may be disposed between the shaft 6 and the cam, in order to transmit one pulse to the yarn brake 105 after only a fixed number of revolutions of the shaft 6.

The yarn feeder 1 described thus far functions as follows:.

In operation, the yarn feeder is secured to a yarn-using machine. To that end, the fastening device 4 is mounted on a retaining ring, and a screw, not shown further in Fig. 5, seated in a nut 140 is tightened. In this process, the ends 69, 70 (Fig. 4) tapering to a point penetrate the insulation of an electrical line, laid along the retaining ring, and make electrical contact with it. The fastening device 4 is also tightly seated on the retaining ring. The two housing parts 25, 33 fitting in one another in the region of the fastening device 4 mutually support one another, so that both of them are equally tightly fastened on the retaining

device. A belt is now placed on at least one of the pulleys 14, 15; the applicable pulley is coupled to the shaft 6, and a yarn is drawn in. The yarn is guided by the yarn inlet eyelets of Fig. 5 or a yarn tubule of Fig. 1 and Fig. 2 to the knot catcher 95 and the yarn brake 105. Here the yarn is clamped between the two rings 105, 107 and then travels via the yarn feeler lever 46 and optionally the yarn eyelet 95a to the yarn guide drum 12. The yarn 2 wraps around this drum once or multiple times, and the yarn 2 then travels, sweeping over the lower rim of the drum 12, to the adjustable yarn guide hoop 197. After passing this hoop, the yarn travels to the outlet eyelet 96. Between the outlet eyelet 96 and the yarn guide hoop 97, the yarn tension feeler 45 rests on the yarn. The introduction of the yarn can be facilitated if the feeler barrier 71 is actuated before the yarn 2 is drawn in; transfers both yarn feelers 45, 46 to their upper, raised position. After the yarn has been drawn in, the feeler barrier is undone by means of the handle 72, and as a result the yarn feelers 45, 46 move downward by their own weight and rest on the yarn 2.

In operation, the yarn guide drum 12 is driven to rotate and draws yarn off via the yarn brake 105. The yarn is fed positively to the textile machine and in the process runs along the lower rim of the drum. The yarn tension in this operation is so great at the two yarn feelers 45, 46 that both feeler levers are in a raised position. Correspondingly, the switches 48, 49 accommodated in the housing are not actuated, and the signal light 50 mounted visibly from all sides on the housing 3 remains dark. However, if one of the yarn feelers 45, 46 drops downward because of a tear in the yarn, then the signal light 50 receives current and lights up. In Fig. 4, this is shown for the yarn feeler 45. It is assumed that at the knot catcher 95 a yarn tear has occurred, so that the yarn is interrupted and the torn-off end of the yarn 2 is just now leaving the yarn brake 105. The yarn feeler 46 therefore drops downward, and as a result the switch 49 responds and appropriate measures can be taken.

If needed, the yarn feeder 1 can be refitted, for instance by replacing the retainer 90 with the cover cap 89. To do so, the fastening screw 64 need merely be loosened somewhat, after which the retainer 90 or the cover cap 89 can be pulled off the coupling clamping device 84. After that, whichever is the other part is slipped onto the coupling clamping device 84 and tightened by tightening the fastening screw 64. The yarn feeder 1 can also be repositioned in a simple way with regard to drawing off yarn. The position of the yarn guide hoop 97 can then be adjusted in such a way that the yarn is pulled more or less via the lower rim or one yarn guide drum 12. It can be adjusted along a path on which at the same time both the level off the yarn guide hoop and its spacing from the pivot axis of the shaft 6 can be varied. The adjusting device is formed by an approximately linear guide with an acute-angled orientation of 30 to 40 from the pivot axis of the shaft 6.

A modified embodiment of the yarn feeder 1 is shown in Fig. 4. It differs from the above-described yarn feeder 1 in terms of the embodiment of the fastening device 4. The fastening device is provided, on the side remote from the jaw, with reinforcing ribs 33a', 33b', 33c', which belong to the housing part 33 and whose special feature is that they protrude front the level that is defined by the lower edge of the drive belt and is suggested in dot-dashed lines Fig. 14. The wall thickness of the ribs 33a', 33b, 33c' is overly great and is substantially less than their respective height. This makes the fastening device 4 so resistant to widening forces that it is possible to dispense with introduction elements, metal inlays or other stiffening additional elements in the clams. Only the nut 140 visible in Fig. 5 is needed. Other metal elements can be omitted.

The yarn feeder 1 of the invention has a plastic housing 3, preferably made of two clamshells. For connection to a retainer on the machine, a fastening device 4 is provided that is made of plastic. The fastening device 4 is made rigid by suitable shaping and

makes do without metal inlays. The two halves of the housing each have one bearing for a continuous shaft, which on one end carries a yarn guide drum and on its other end carries pulleys 14, 15, for instance, as a drive device. Fastening means serve to hold the two housing parts together in the correct position. The housing 3 is easy to open for maintenance purposes.

20020700-032902

Claims

1. A yarn feeder (1), in particular for textile
5 machines,

having a housing (3) , which has a fastening clamp
(4) for fastening to a retaining device on the machine,

10 characterized in that

the housing (3) is embodied of plastic, and

that the fastening clamp (4) has a box profile-like
15 cross section, whose portions that receive clamping force
are entirely embodied of the housing material.

2. A yarn feeder (1), in particular for textile
20 machines,

having a housing (3), which has a fastening clamp
(4) for fastening to a retaining device on the machine,

having a shaft (6) passing through the housing (3),
25 which shaft on one end carries a yarn guide drum (12) and
on its other end carries at least one pulley (14) for
driving the yarn guide drum (12) by means of a drive belt
provided on the textile machine,

30 characterized in that

the housing (3) including the fastening clamp is
embodied of plastic, and

35 that portions (33a', 33b', 33c') are embodied on
the fastening clamp (4) that extend to beyond a plane
that is defined by the edge of the drive belt toward the
yarn guide drum (12).

40 3. A yarn feeder (1), in particular for textile
machines,

having a housing (3), which has a fastening clamp
(4) for fastening to a retaining device on the machine,

having a shaft (6) passing through the housing (3),
which shaft on one end carries a yarn guide drum (12) and
on its other end is connected to a drive device (14),

having yarn guide means (95a, 97), which define a
yarn travel path toward the yarn guide drum (12) and away
from the yarn guide drum (12),

having at least two bearing means (7, 8) which for
supporting the shaft (6) are disposed in the housing (3),
characterized in that

the housing (3) has at least one first housing part
(25), which is oriented toward the yarn guide drum (12)
and has a bearing seat (10) for one of the bearing means
(8),

that the housing (3) has at least one second
housing part (33), which is oriented toward the drive
device (14) and has the other bearing means (7), and

that at least one connecting means (64) for
positionally correctly/ connecting the housing parts (25,
33) to one another is provided.

4. The yarn feeder of claim 3, characterized in
that the housing (3) has a substantially horizontal
dividing seam (83), and the housing parts (25, 33)
preferably have alignment means (32, 34, 35), which
associate the housing parts (25, 33) positionally
correctly with one another; that the two bearing means
are ball bearings (7, 8), and that the housing parts (25,
33) each have one bearing seat (9, 10) for one of the

ball bearings (7, 8), and the bearing seats (9, 10) are preferably formed by tubular attachments, pointing away from one another, that are embodied on the housing parts (25, 33).

5

5. The yarn feeder of claim 4, characterized in that the tubular attachment oriented toward the yarn guide drum (12) extends into an interior defined by the yarn guide drum (12).

6. The yarn feeder of claim 4, characterized in that bearing receiving elements of elastomer are disposed between the bearing seats (9, 10) and the ball bearings (7, 8), and that interrupted bearing faces are embodied on the bearing seats (9, 10), which faces protrude radially inward in the direction toward the ball bearings (7, 8).

15
20

7. The yarn feeder of claim 1, 2 or 3, characterized in that the fastening clamp or device (4) has a jaw for receiving the retaining device on the machine, and that, if the housing (3) is in two parts, the jaw is embodied on at least one of the housing parts (25, 33)

8. The yarn feeder of claim 7, characterized in that the housing parts (25, 33) are embodied fitting over one another in the region of the fastening device (4), and that the housing parts (25, 33) are joined together by at least one support means (27, 28) in the region of the fastening device (4).

30
35

9. The yarn feeder of claim 1, 2 or 3, characterized in that a coupling device (86) for connecting at least one further housing part (89) or

40

fixture (90) as needed is provided on the housing (3)

10. The yarn feeder of claim 9, characterized in
5 that the coupling device (86) is disposed above the
fastening clamp or device (4)

11. The yarn feeder of claim 3, characterized in
10 that the housing (3) is embodied of plastic.

12. The yarn feeder of claim 1, 2 or 11,
characterized in that in the housing (3), receptacles are
15 provided, into which metal elements (38, 39) are placed
that act as conductor tracks, for instance for electric
switches, shutoff means, indicator lights, or other
electrical components.

13. The yarn feeder of claim 1, 2 or 11,
characterized in that disposed in the housing is an
electrically grounded conductor, which is connected to at
least one element (95) that is in contact with the yarn.

14. The yarn feeder of claim 13, characterized in
that movably supported sensor elements, such as yarn
feelers (45) or shutoff means, are supported on the metal
25 elements.

15. The yarn feeder of claim 1, characterized in
that the interior of the fastening clamp (4) defined by
35 the box profile-like cross section includes ribs (33a',
33b' 33c') disposed parallel to one another.

Abstract:

5 The yarn feeder of the invention has a plastic
housing, preferably made of two clamshells. For
connection to a retainer on the machine, a fastening
device is provided that is made of plastic. The fastening
device is made rigid by suitable shaping and makes do
10 without metal inlays. The two halves of the housing each
have one bearing for a continuous shaft, which on one end
carries a yarn guide drum and on its other end carries
pulleys, for instance, as a drive device. Fastening means
serve to hold the two housing parts together in the
15 correct position. The housing is easy to open for
maintenance.
